point

Congratulations! You passed!

Which of the following are true? (Check all that apply.)

 $a_4^{[2]}$ is the activation output by the 4^{th} neuron of the 2^{nd} layer

Correct

Un-selected is correct

 $a_4^{[2]}$ is the activation output of the 2^{nd} layer for the 4^{th} training example

 $a^{[2](12)}$ denotes activation vector of the 12^{th} layer on the 2^{nd} training example.

Next Item

Un-selected is correct

 \boldsymbol{X} is a matrix in which each row is one training example.

Un-selected is correct

Correct

 $a^{[2](12)}$ denotes the activation vector of the 2^{nd} layer for the 12^{th} training example.

 \boldsymbol{X} is a matrix in which each column is one training example.

Correct

Correct

 $a^{[2]}$ denotes the activation vector of the 2^{nd} layer.

2.

point

its output is closer to zero, and so it centers the data better for the next layer. True/False? True

The tanh activation usually works better than sigmoid activation function for hidden units because the mean of

Yes. As seen in lecture the output of the tanh is between -1 and 1, it thus centers the data which makes the learning simpler for the next layer.

False

point

 $egin{aligned} ullet & Z^{[l]} = W^{[l]} A^{[l]} + b^{[l]} \ & A^{[l+1]} = g^{[l+1]} (Z^{[l]}) \end{aligned}$

Correct

3. Which of these is a correct vectorized implementation of forward propagation for layer l, where $1 \le l \le L$?

Correct

 $lacksquare Z^{[l]} = W^{[l]}A^{[l-1]} + b^{[l]}$ $ullet \ A^{[l]} = g^{[l]}(Z^{[l]})$

 $ullet \ Z^{[l]} = W^{[l-1]} A^{[l]} + b^{[l-1]}$ $ullet \ A^{[l]} = g^{[l]}(Z^{[l]})$

 $ullet \ A^{[l+1]} = g^{[l]}(Z^{[l]})$

 $lacksquare Z^{[l]} = W^{[l]}A^{[l]} + b^{[l]}$

4. You are building a binary classifier for recognizing cucumbers (y=1) vs. watermelons (y=0). Which one of these activation functions would you recommend using for the output layer?

point

sigmoid Correct Yes. Sigmoid outputs a value between 0 and 1 which makes it a very good choice for binary classification.

ReLU

Leaky ReLU

done with tanh as well but it is less convenient as the output is between -1 and 1.

You can classify as 0 if the output is less than 0.5 and classify as 1 if the output is more than 0.5. It can be

5.

point

Consider the following code:

tanh

1 A = np.random.randn(4,3)B = np.sum(A, axis = 1, keepdims = True)

Correct Yes, we use (keepdims = True) to make sure that A.shape is (4,1) and not (4,). It makes our code more

(4, 1)

rigorous.

(, 3)

point

following statements is true?

neurons.

symmetry".

point

symmetry", True/False?

Correct

7.

(4,)(1, 3)

What will be B.shape? (If you're not sure, feel free to run this in python to find out).

Each neuron in the first hidden layer will perform the same computation. So even after multiple iterations of gradient descent each neuron in the layer will be computing the same thing as other

Correct

6.

The first hidden layer's neurons will perform different computations from each other even in the first iteration; their parameters will thus keep evolving in their own way.

Suppose you have built a neural network. You decide to initialize the weights and biases to be zero. Which of the

Each neuron in the first hidden layer will perform the same computation in the first iteration. But after

one iteration of gradient descent they will learn to compute different things because we have "broken

Each neuron in the first hidden layer will compute the same thing, but neurons in different layers will

compute different things, thus we have accomplished "symmetry breaking" as described in lecture.

True False

Yes, Logistic Regression doesn't have a hidden layer. If you initialize the weights to zeros, the first

example x fed in the logistic regression will output zero but the derivatives of the Logistic Regression

weights values follow x's distribution and are different from each other if x is not a constant vector.

depend on the input x (because there's no hidden layer) which is not zero. So at the second iteration, the

Logistic regression's weights w should be initialized randomly rather than to all zeros, because if you initialize to

all zeros, then logistic regression will fail to learn a useful decision boundary because it will fail to "break

You have built a network using the tanh activation for all the hidden units. You initialize the weights to relative large values, using np.random.randn(..,..)*1000. What will happen? This will cause the inputs of the tanh to also be very large, thus causing gradients to be close to zero.

Correct

8.

point

optimization algorithm.

point

9.

 x_2

The optimization algorithm will thus become slow.

whether the weights are large or small.

Consider the following 1 hidden layer neural network:

 $W^{[1]}$ will have shape (2, 4)

 $b^{[1]}$ will have shape (4, 1)

 $W^{[1]}$ will have shape (4, 2)

 $W^{[2]}$ will have shape (1, 4)

 $b^{[2]}$ will have shape (4, 1)

Un-selected is correct

Correct

Correct

Correct

This will cause the inputs of the tanh to also be very large, thus causing gradients to also become large. You therefore have to set α to be very small to prevent divergence; this will slow down learning.

thus speed up learning compared to if the weights had to start from small values.

Yes. tanh becomes flat for large values, this leads its gradient to be close to zero. This slows down the

It doesn't matter. So long as you initialize the weights randomly gradient descent is not affected by

This will cause the inputs of the tanh to also be very large, causing the units to be "highly activated" and

Which of the following statements are True? (Check all that apply).

 $b^{[1]}$ will have shape (2, 1) **Un-selected** is correct

 $W^{[2]}$ will have shape (4, 1)

Un-selected is correct

Un-selected is correct

Correct

10.

In the same network as the previous question, what are the dimensions of $Z^{[1]}$ and $A^{[1]}$?

point

 $b^{[2]}$ will have shape (1, 1)

 $Z^{[1]}$ and $A^{[1]}$ are (4,m) Correct

 $Z^{\left[1
ight]}$ and $A^{\left[1
ight]}$ are (4,2)

 $Z^{\left[1
ight]}$ and $A^{\left[1
ight]}$ are (4,1)

 $Z^{\left[1
ight]}$ and $A^{\left[1
ight]}$ are (1,4)
